Acta Crystallographica Section E: Structure Reports Online is the IUCr's highly popular open-access structural journal. It provides a simple and easily accessible publication mechanism for the growing number of inorganic, metal-organic and organic crystal structure determinations. The electronic submission, validation, refereeing and publication facilities of the journal ensure very rapid and high-quality publication, whilst key indicators and validation reports provide measures of structural reliability. In 2007, the journal published over 5000 structures. The average publication time is less than one month.

Received 26 November 2010; accepted 6 December 2010

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.007$ Å; R factor = 0.067; wR factor = 0.145; data-to-parameter ratio = 8.1.

In the title compound, $C_{16}H_{13}N_7O$, the 1,2,4-triazolo[1,5-*a*]-[1,3,5]triazine heterocyclic system is essentially planar (r.m.s. deviation = 0.0375 Å). The attached benzene ring lies almost in the mean plane of 1,2,4-triazolo[1,5-*a*]-[1,3,5]triazine [dihedral angle = 1.36 (23)°], while the pyridine ring is turned out of this plane by the aminomethyl bridge [dihedral angle = 69.22 (9)°]. The amino group H atom is involved in intramolecular hydrogen bonding with a triazole N atom. In the crystal, molecules are connected *via* $C(=O)NH \cdots N$ hydrogen bonds into $C(11)$ chains parallel to [100]. The amino group H atom acts as a hydrogen-bond donor, forming an $NH \cdots O=C$ hydrogen bond with the carbonyl O atom, which links the molecules into $C(6)$ chains running along [011] and [01 $\bar{1}$].

2-Phenyl-7-(4-pyridylmethylamino)-1,2,4-triazolo[1,5-*a*][1,3,5]triazin-5(4*H*)-one

A. V. Dolzhenko, G. K. Tan, A. V. Dolzhenko, L. L. Koh and W. K. Chui

Comment

The 1,2,4-triazolo[1,5-*a*]triazines are 5-azaisosters of the purine heterocyclic system that carries a bridge nitrogen atom. They have been shown to possess a variety of promising biological effects (Dolzhenko *et al.*, 2006). In continuation of our works on the synthesis and structural investigations of 1,2,4-triazolo[1,5-*a*][1,3,5]triazines (Dolzhenko *et al.*, 2007*a,b*; Dolzhenko *et al.*, 2008), we report herein molecular and crystal structure of 2-phenyl-7-(4-pyridylmethylamino)-1,2,4-triazolo[1,5-*a*][1,3,5]triazin-5-one, C₁₆H₁₃N₇O. (Fig. 1 & 2).

The 1,2,4-triazolo[1,5-*a*][1,3,5]triazine heterocyclic system is essentially planar with a r.m.s. deviation of 0.0375 Å. The phenyl ring lies practically in the plane of the 1,2,4-triazolo[1,5-*a*][1,3,5]triazine core (with a small dihedral angle of 1.36 (23)° between the mean planes). The amino group nitrogen atom N6 is located 0.2246 (50) Å above the 1,2,4-triazolo[1,5-*a*][1,3,5]triazine mean plane. The pyridine ring is turned out of this plane by twisting of the aminomethyl bridge [C3—N6—C11—C14 torsion angle is 118.50 (40)°]. This results in a dihedral angle of 69.22 (9)° between the 1,2,4-triazolo[1,5-*a*][1,3,5]triazine and pyridine mean planes. The amino group N6H hydrogen atom acts as a hydrogen donor in the NH⋯N intramolecular hydrogen bonding with the triazole N1 atom.

In the crystal, molecules form a three dimensional network of chains. The *C*(11) chains (Bernstein *et al.*, 1995) parallel to a [100] axis consist of the molecules linked *via* the CONH⋯N hydrogen bonds between the triazine N6H atom and the N7 atom of pyridine ring. The *C*(6) chains running along [011] and [01 $\bar{1}$] directions are made of the molecules connected *via* the NH⋯O=C contacts between the N6—H amino group acting as a hydrogen donor and the carbonyl group O1 atom in the role of a hydrogen acceptor.

Experimental

7-Methylthio-2-phenyl-1,2,4-triazolo[1,5-*a*][1,3,5]triazin-5-one (0.52 g, 2 mmol) was added to a solution of 4-pyridylmethylamine (0.32 g, 3 mmol) in DMF (5 ml) and the mixture was heated at 70–80°C with stirring for 6 h. After cooling, ice cold water (40 ml) was added and the product was filtered and recrystallized from methanol. Yield: 0.56 g (87%), m.p. 567 K.

Refinement

All C-bound H atoms were positioned geometrically and included in the refinement in riding-motion approximation [0.95 Å for aromatic CH and 0.99 Å for methylenic protons; $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}_{\text{Ar}})$ and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}_{\text{methylenic}})$] while the N-bound H atoms were located in a difference map and refined freely. 1221 Friedel pairs were merged.

$$\Delta\rho_{\min} = -0.27 \text{ e } \text{\AA}^{-3}$$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
